

A link-to is essentially an a href. It is setup like this though:

```
{{#link-to 'route'}} Go to [specified route name]{{/link-to}}
```

To create a route run the command: `ember generate route [name of page i.e. the second page you want on your website.]`

this will create two folders for you:

1. `app/routes/name.js`—code that Ember will run when route is loaded.
2. `app/templates/name.hbs`—the template for the route. It will render into the `{{outlet}}` in the `index.html` file. [`.hbs` is the handlebars template that Ember runs off of.]

Routes are responsible for setting up data that Ember will use when rendering the template for that specified route. Consider these single pages. The routes will always be in your `app.js` file.

example of routes:

```
App.Router.map(function(){  
  this.route('name');  
  this.route('name');  
  this.route('name');  
});
```

When you create a route it should automatically create a controller, and it should create the `"this.route('name');"` for you. If it does not, you need to do it or your pages/route is useless.
